Stirred, Not Shaken: Utility of Viscoelastic Testing for Monitoring Coagulation in Critically Ill Populations

Megan Rech, PharmD, MS, BCCCP, FCCM

Loyola University Medical Center

Maywood, Illinois

 @MeganARech

Learning Objectives

Discuss coagulation and risk factors for coagulopathy

Describe the use of viscoelastic tests in critically ill emergency department (ED) patients

Disclosures

Research funding from Spero Pharmaceuticals*

Advisory board for Harm Reduction Therapeutics*

*The relevant financial relationship listed for this individual has been mitigated

Patient Case

MS is a 45-year-old male with past medical history of non-ischemic cardiomyopathy status-post left ventricular assist device placement on warfarin who presents to the ED with subdural hematoma measuring $2.6 \times 3.5 \times 3.1$ centimeters. His physical examine is within normal limits except a scalp hematoma and altered mental status. All labs were normal except INR was 3.6 and serum creatinine was 1.52 mg/dL.

Coagulopathy in Acute Illness

Very common

Predictive of poor outcomes

Difficult to recognize & treat

Risk Factors for Coagulopathy

Trauma

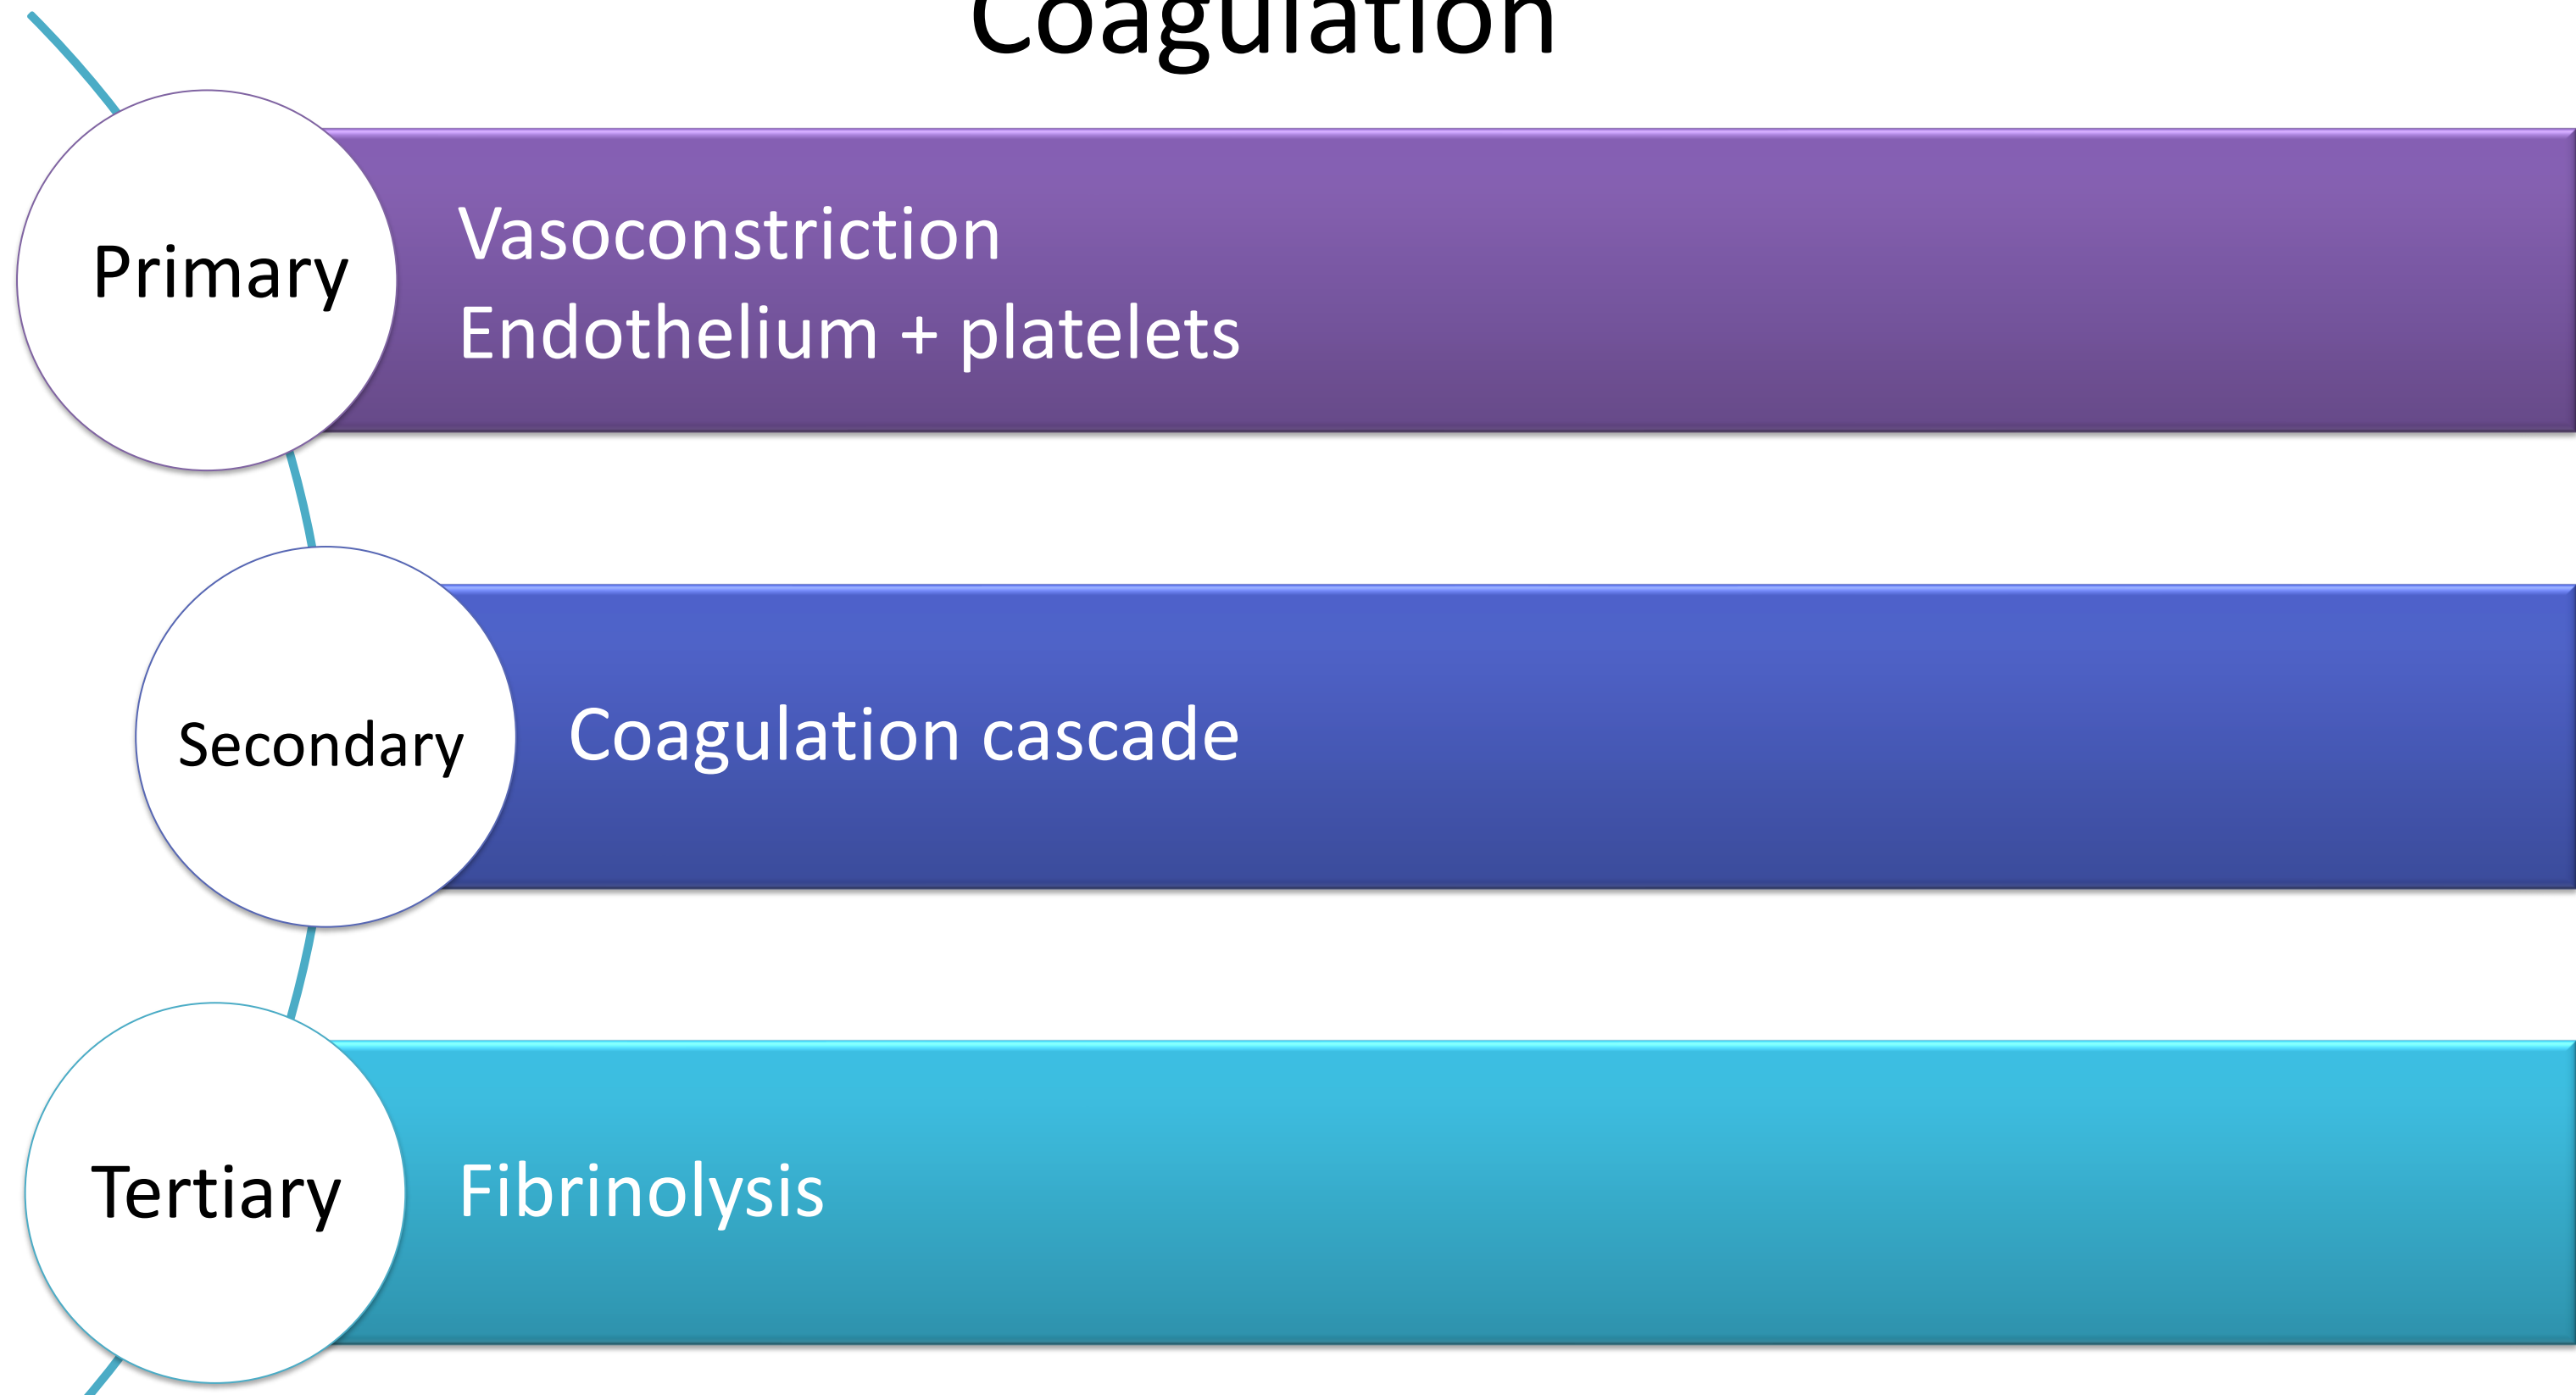

Liver disease

Medications

Active bleeding

Hypothermia

Coagulation

Coagulation

Inactive platelets

Endothelium

Coagulation

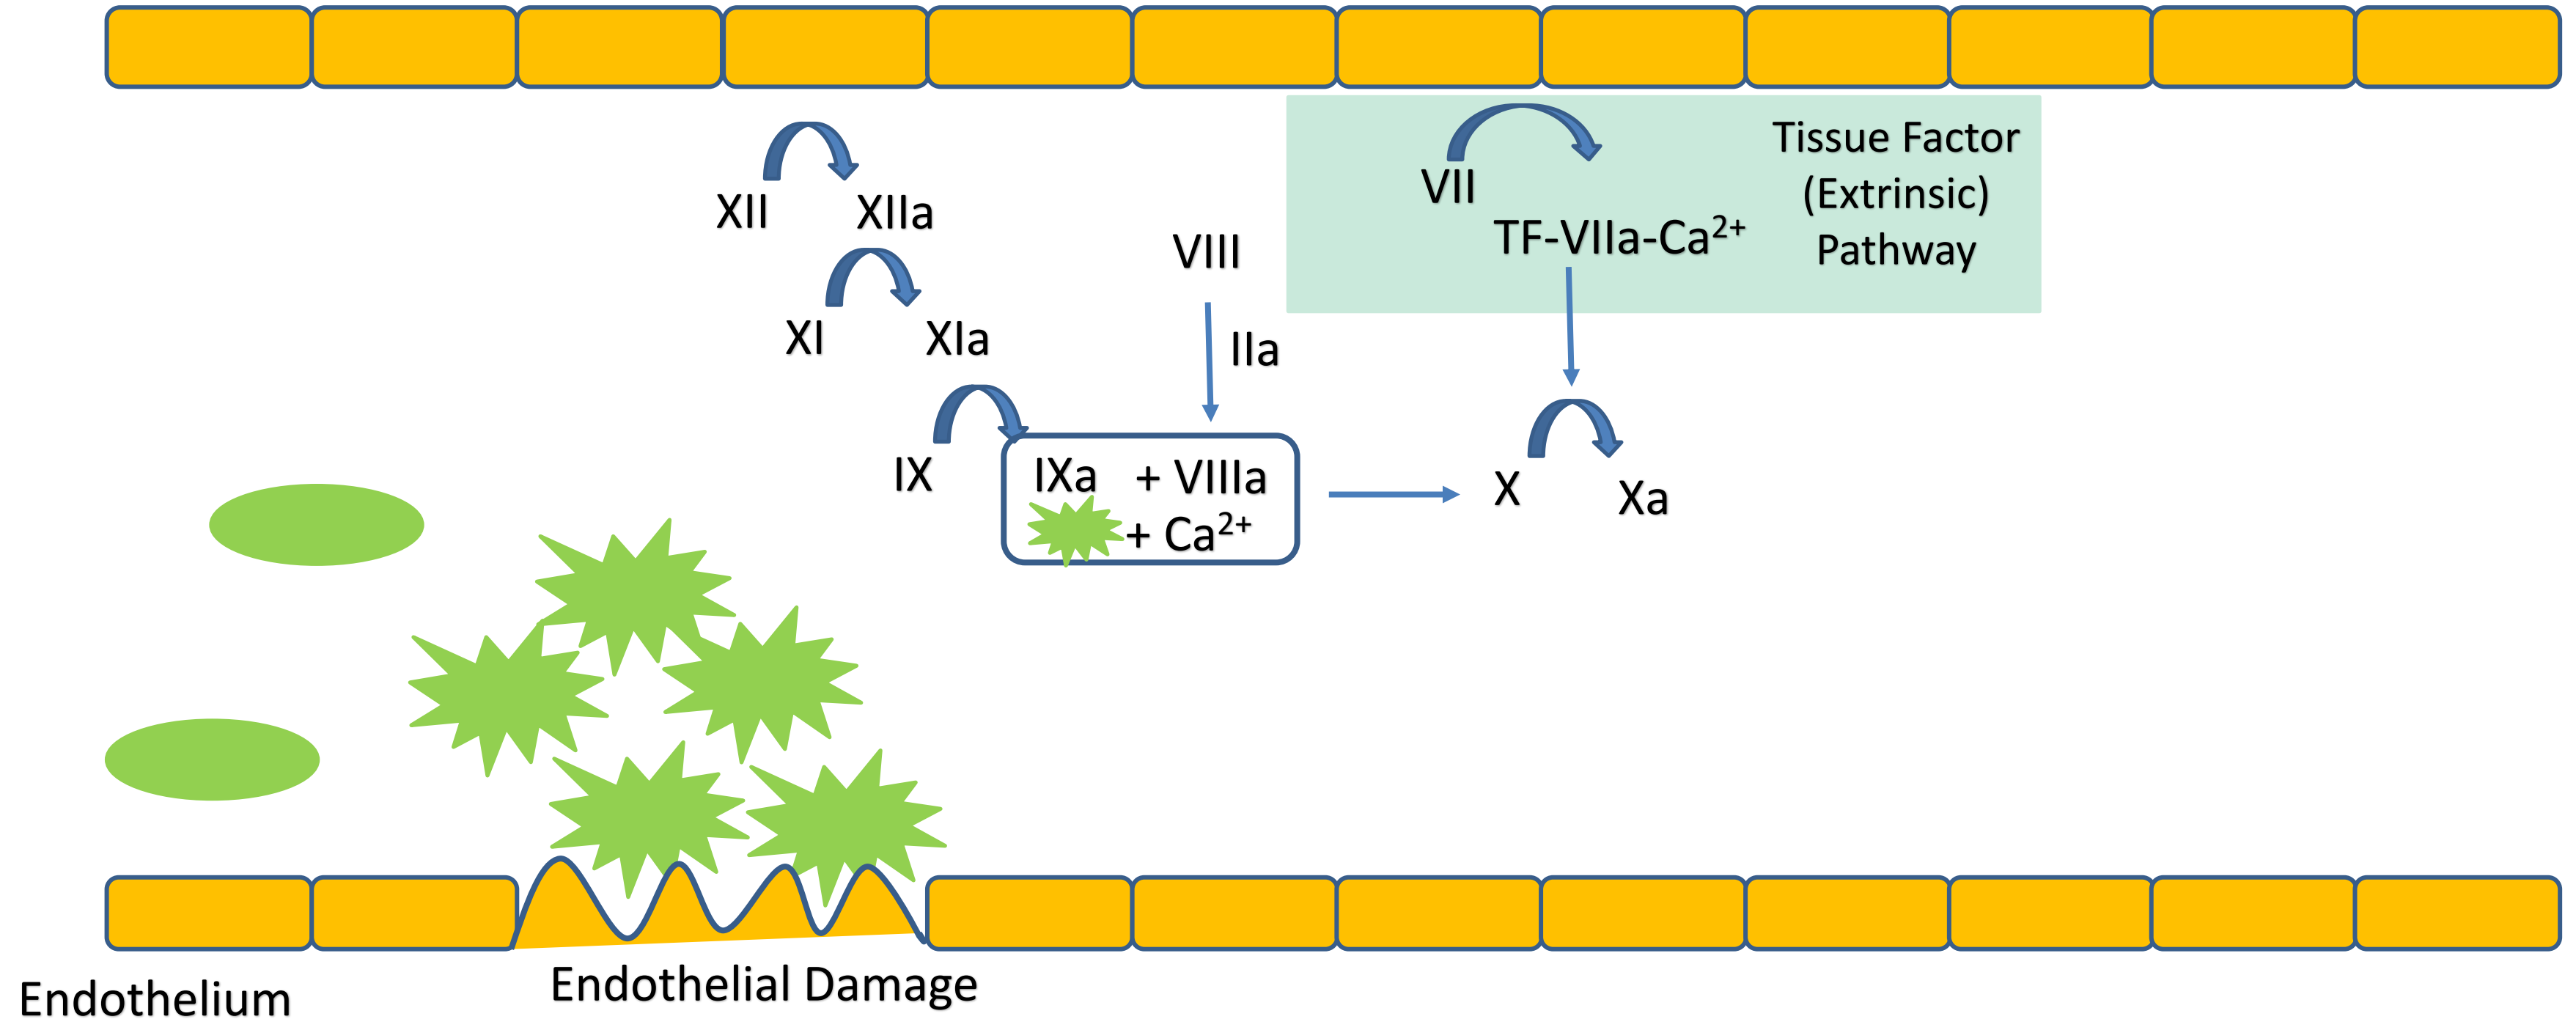

Coagulation

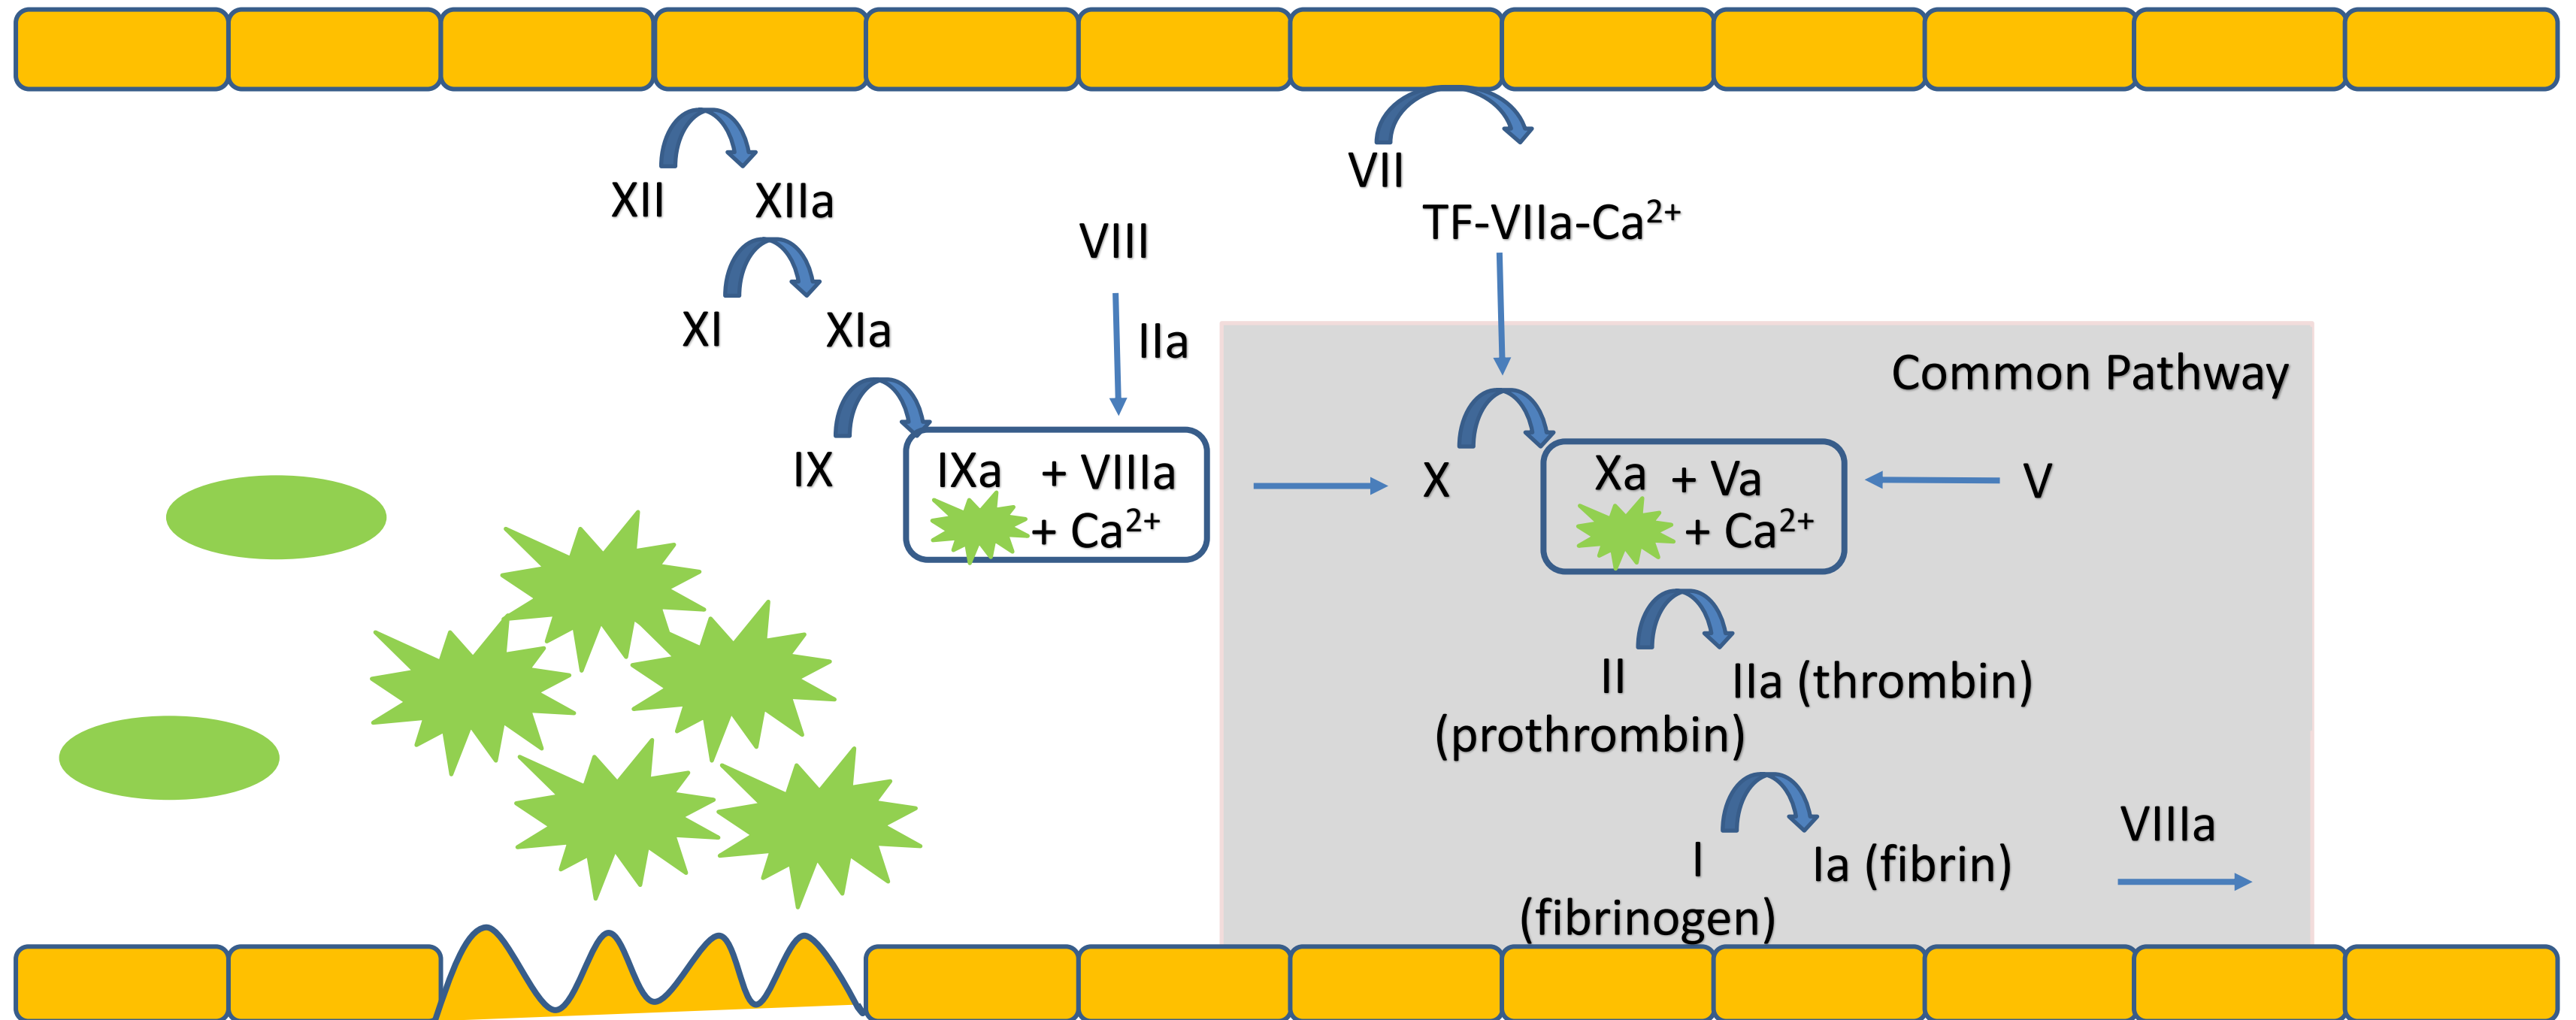

Coagulation

Coagulation

Coagulation

Coagulation

Coagulation

What Could Go Wrong?

Deranged hemostasis

- Consumptive
- Blood loss
- Decreased production

Hyper-fibrinolysis

- Liver disease
- Inherited disorder
- Acquired condition

Secondary causes

- Hypothermia
- Acidosis
- Hypocalcemia

Question 1

Which of the following is a risk factor for coagulopathy?

- a) Trauma
- b) Hypothermia
- c) End stage liver disease
- d) Sepsis
- e) All of the above

Measurements of Coagulation

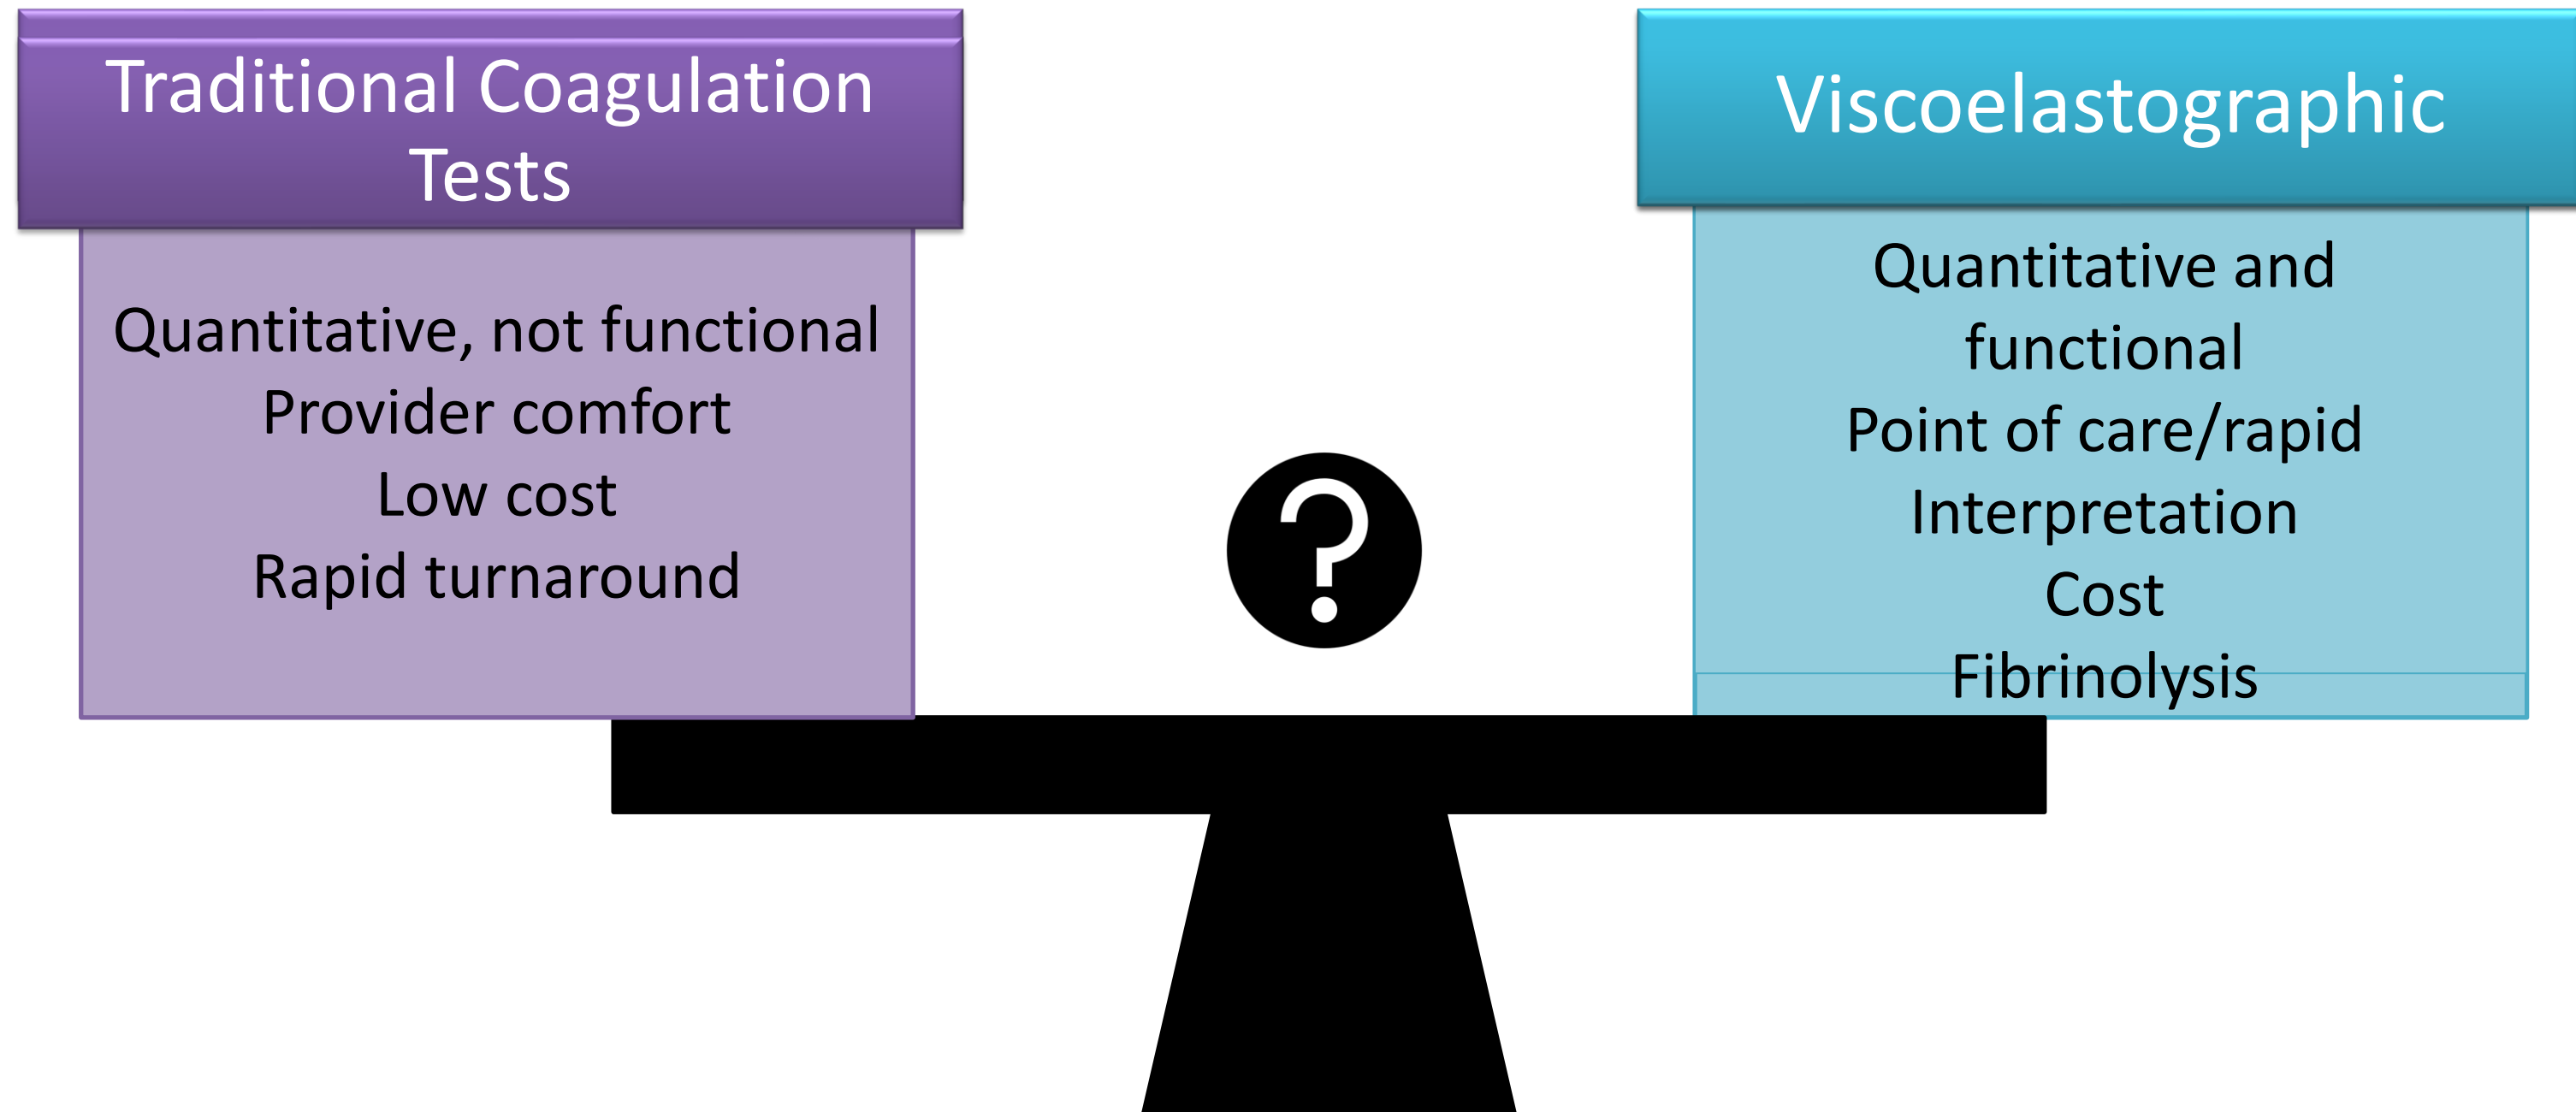

Traditional Coagulation Tests

- International normalized ratio (INR)
- Prothrombin time (PT)
- Partial thromboplastin time (aPTT)
- Complete blood count (CBC)
- D-dimer

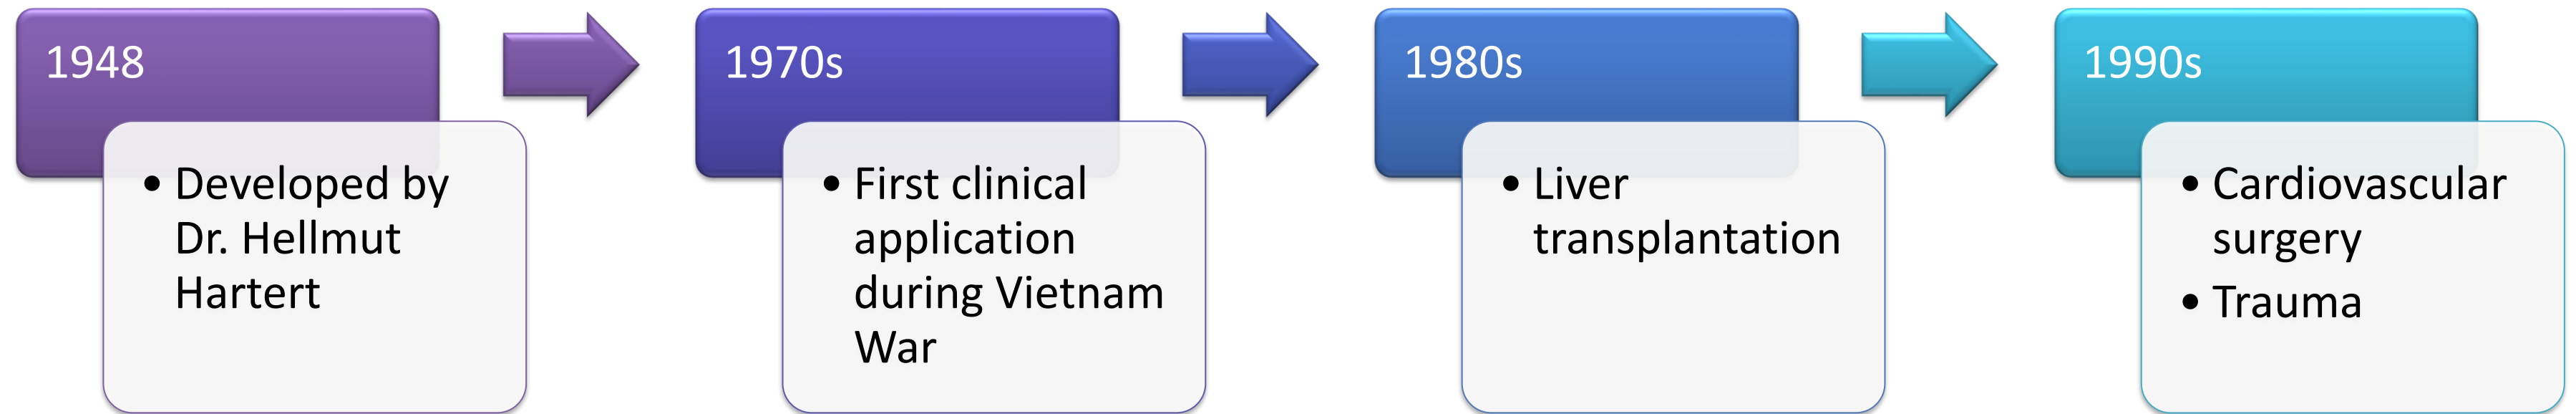

Viscoelastographic Tests

- Thromboelastography (TEG®)
- Rotational thromboelastometry (ROTEM®)

Weighing the Options

Old Test, New Applications

Devices

How it Started...

How it's Going...

What is Viscoelastography (VE)?

What is Viscoelastography (VE)?

What is Viscoelastography (VE)?

Comparing TEG and ROTEM

TEG

- 2 samples simultaneously
- Kaolin/tissue factor
- HTEG
- Platelet mapping, fibrin function capabilities

ROTEM

- 4 samples simultaneously
- INTEM
- EXTEM
- HEPTTEM
- FIBTEM

Results NOT Interchangeable

VE Parameters

Term	TEG	ROTEM	Normal Value	Clinical Measurement
R= Reaction Time	+	-	3.8 – 9.8 minutes	Time from start to clot initiation
ACT= activated clotting time	+*		86 – 118 seconds	
CT= Clotting Time	-	+	42 – 74 seconds	

*rTEG only

Where's VE?

Where's VE?

Where's VE?

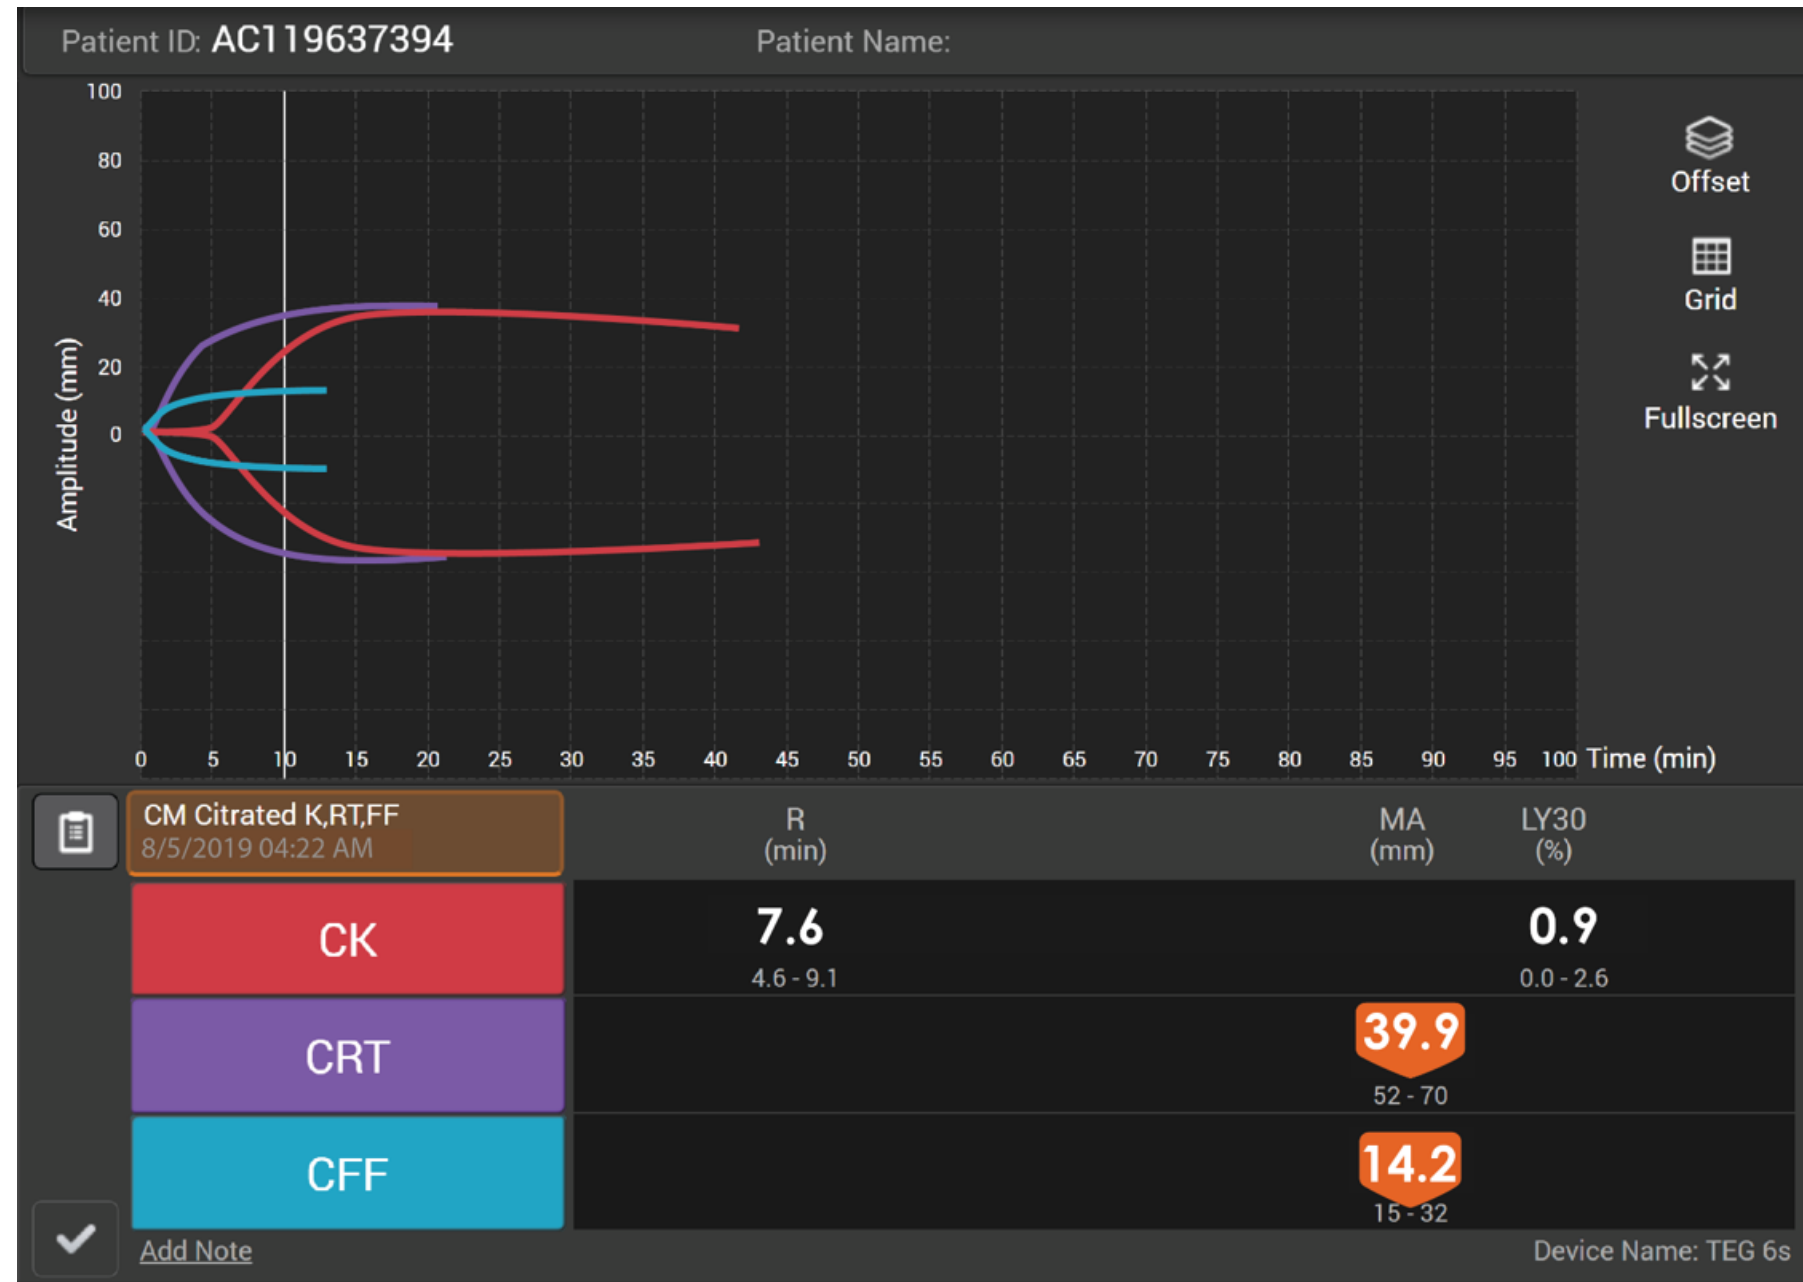

Question 2

Which of the following components of viscoelastic testing determines the time to start of clot formation?

- a. Maximal clot firmness
- b. Reaction time
- c. Alpha angle
- d. Lysis 30 minutes (LY30)

Sample Tracings

Application

↑R/CT

Fresh frozen plasma (FFP) or prothrombin complex concentrate (PCC)

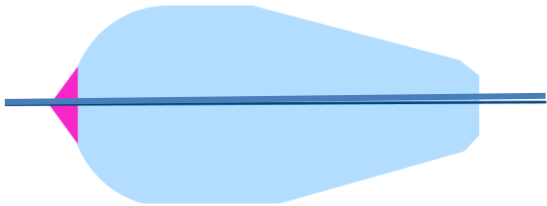

↓MA/MCF

Cryoprecipitate (if FIBTEM/fibrin function[FF]↓)
Platelets (if FIBTEM/FF normal)

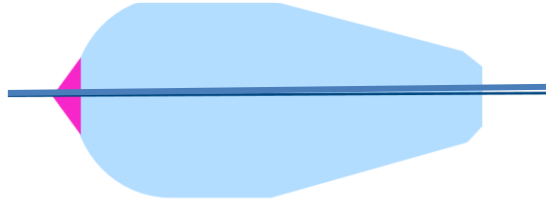

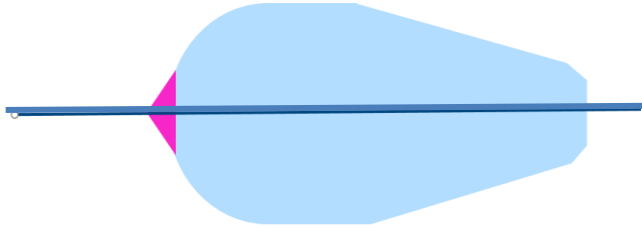

↑LY30/LI30

Tranexamic acid (TXA)

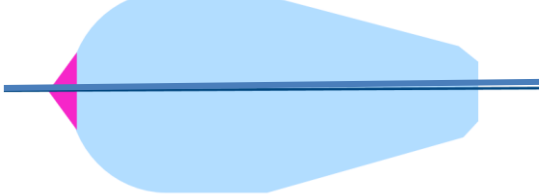

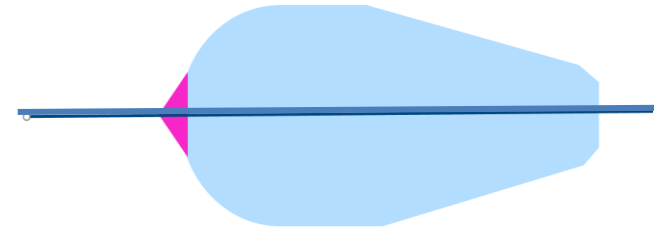

Shaken, Not Stirred or Stirred, Not Shaken?

Description	Tracing	Glass	Action
Normal			Do nothing!

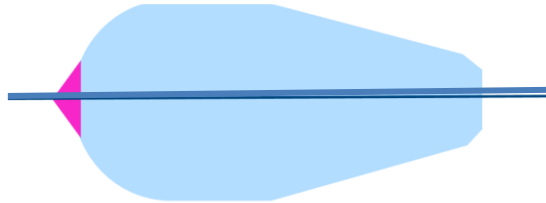

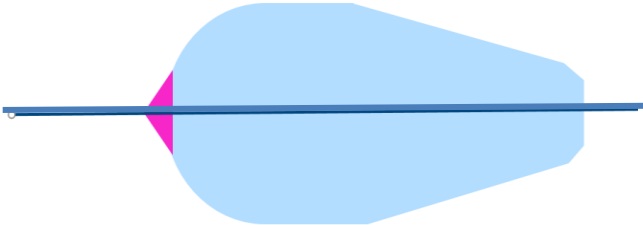

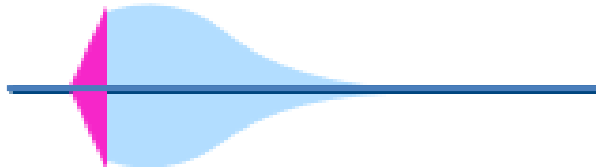

Shaken, Not Stirred or Stirred, Not Shaken?

Description	Tracing	Glass	Action
Normal			Do nothing!
Anticoagulated Hemophilia			FFP or PCC

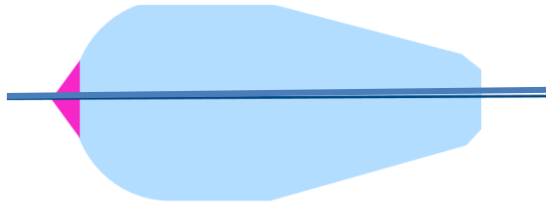

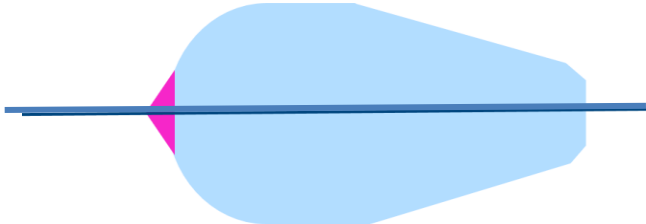

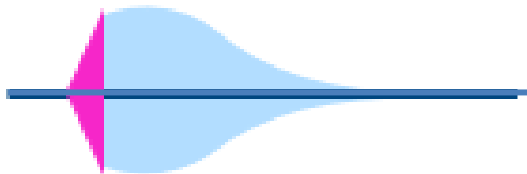

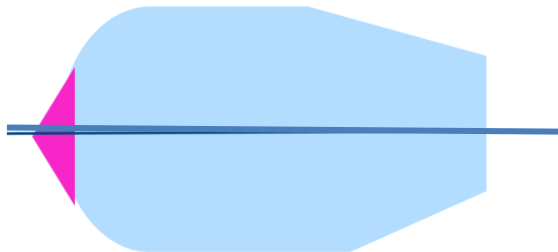

Shaken, Not Stirred or Stirred, Not Shaken?

Description	Tracing	Glass	Action
Normal			Do nothing!
Anticoagulated Hemophilia			FFP or PCC
↓ Fibrinogen/ platelets			Platelets Cryoprecipitate

Shaken, Not Stirred or Stirred, Not Shaken?

Description	Tracing	Glass	Action
Normal			Do nothing!
Anticoagulated Hemophilia			FFP or PCC
↓ Fibrinogen/ platelets			Platelets Cryoprecipitate
Fibrinolysis			TXA

Shaken, Not Stirred or Stirred, Not Shaken?

Description	Tracing	Glass	Action
Normal			Do nothing!
Anticoagulated Hemophilia			FFP or PCC
↓ Fibrinogen/ platelets			Platelets Cryoprecipitate
Fibrinolysis			TXA
Hypercoagulability			Monitor vs. anticoagulation

Why don't we use this everywhere?

Training & expertise

Wide range of “normal”, not static

Logistics & standardization

\$\$\$

Data lacking

Where should we use it?

Ischemic
stroke

Trauma

Intracranial
Hemorrhage

Liver Disease

Surgery (CV,
liver
transplant)

Anticoagulant
Monitoring*

Goal-Directed Hemostatic Resuscitation

- Single center RCT of L1 trauma patients requiring MTP activation
- TEG (n=56) or conventional coagulation assays (CCA; n=55)
- Baseline demographics similar
 - TBI: 16% TEG vs. 21.8% CCA
- TEG group ↑ survival at 28 days
- Blood Products:
 - Similar PRBCs (4.5 units TEG vs. 5 units CCA, p=0.32)
 - ↓ FFP (0 TEG vs. 2 CCA, p=0.02)
 - ↓ platelets (0 TEG vs. 0 CCA, p=0.04)

Acute Ischemic Stroke

Prospective observational study of 246 mild to moderate AIS (NIHSS ≤ 14) aimed to determine if TEG on admission for predicting early neurological deterioration (END)

TEG Parameter, mean	END (n=72)	Non-END (n=174)
R	4.5 \pm 1*	4.7 \pm 1.2
K	1.3 \pm 0.4*	1.5 \pm 0.4
MA	64.3 \pm 6.1	63.5 \pm 5.7
α angle	70 \pm 4.9	68.7 \pm 5.3
LY30	95.6	95.8

After adjustment, the lower tertile of R (R ≤ 3.8 min) was associated with END (OR 3.556, 95% CI 1.17 -10.86)

ROC analysis demonstrated that R ≤ 3.45 minutes had the best predictive value for END with 87.9% sensitivity and 40.3% specificity

And Hemorrhagic Transformation?

205 patients with AIS s/p alteplase, TEG within 6 hours

TEG Variable	Hemorrhagic Transformation (N=28)	No Hemorrhagic Transformation (N=177)	P Value
R, minutes, mean (SD)	4.3 ± 0.8	4.7 ± 1.1	0.1
K, minutes, median (IRQ)	1.5 (1.2–1.8)	1.4 (1.2–1.7)	0.11
Alpha angle, degrees, median (IRQ)	68.4 (62.9–72.5)	69.6 (65.3–72.9)	0.26
MA, degrees, mean (SD)	61.1 ± 7.1	62.2 ± 8.7	0.54
LY30, %, median (IQ)	2.6 (0.1–6.5)	1.8 (0.4–5.4)	0.43

In multivariate logistic regression analysis, R<5 minutes was associated with hemorrhagic transformation (OR 3.215, 95% CI 1.153–8.969)

Intracranial Hemorrhagic

Prospective observational cohort of 64 spontaneous ICH patients vs. 57 controls

Variable, mean \pm SD	Baseline ICH (n=64)	36 Hours ICH (n=27)	Controls (n=57)	Hematoma Expansion (n=11)	No Hematoma Expansion (n=38)
R	4.7 \pm 1.7*	6.5 \pm 4.4	6.1 \pm 1.8	5.7 (4.5-6.9)	4.4 (3.5-5.4)
K	2.1 \pm 1.6	2.1 \pm 2.8	2.1 \pm 0.6	3.1 (2.0-4.1)*	1.6 (0.6-2.6)
MA	64.5 \pm 14.1*	70.7 \pm 4.8*	64.4 \pm 5.8	61.7 (52.0-71.4)	61.6 (53.5-69.7)
α angle	64.4 \pm 10.8	66.4 \pm 12.3	61.3 \pm 5.8	58.0 (50.6-65.4)	62.0 (55.8-68.1)

*P<0.05 relative to control

In adjusted analysis, baseline K was longer in HE+ compared with HE- patients (median K 3.1 [2 - 4.1] vs. 1.6 [0.6 - 2.6], P=0.04)

Last but not least..

MS is a 45-year-old male with past medical history of non-ischemic cardiomyopathy status-post left ventricular assist device placement on warfarin who presents to the ED with subdural hematoma measuring 2.6 × 3.5 × 3.1 centimeters. His physical examine is within normal limits except a scalp hematoma and altered mental status. All labs were normal except INR was 3.6 and serum creatinine was 1.52 mg/dL.

30 minutes s/p 4F-PCC 2000 fIXa units IVPB and vitamin K 5 mg IVPB ROTEM:

ROTEM Parameter	Extrinsic ROTEM
Clot time (CT), seconds (reference range)	77 (43-82)
Clot formation time (CFT), seconds (reference range)	196 (48-127)
α-angle, degrees (reference range)	77 (65-80)
Amplitude at 10 minutes (A10), millimeters (reference range)	69 (46-67)
Maximum Clot Firmness (MCF), millimeters (reference range)	74 (52-70)
Lysis Index at 30 minutes (LI30), % (reference range)	100 (94-100)

Fig. 2. Patient ROTEM® (Extrinsic).

Question 3

Based on this ROTEM, what should we give?

- a) Order additional 500 fIXa units of 4F-PCC
- b) No additional factors needed
- c) Order platelets
- d) Order fresh frozen plasma

Conclusions

- Coagulopathy is common in critically ill patients
- VE testing is useful to guide management of coagulopathy in many patient populations
- VE has been studied across a wide range emergencies, though further research is needed to determine its role beyond a prognostic tool in most settings outside of trauma
